

Integrated, women-centered care makes Princeton Radiology the right choice for women's imaging services.

☉ **Proactive approach to risk assessment, screening, and early detection.**

With services like 3D digital SmartMamm,™ including a lifetime risk assessment with each mammogram, along with Smart Breast MRI™ for women with dense breasts or other risk factors, we help you and your doctor formulate the right screening regimen for you.

☉ **A team of women's imaging experts.**

Imaging study interpretations and breast biopsies performed by board certified, subspecialty trained women's imaging physicians.

☉ **We respect your time.**

Fast scheduling, less time in the waiting room, and prompt results to your doctor.

☉ **Patient-friendly hours.**

We offer daytime, evening and weekend hours.

☉ **Conveniently accessible.**

Easy access to comprehensive women's imaging services with ample parking at our convenient locations.

☉ **Comfortable experience.**

Our goal is to provide every patient with the most comfortable and positive experience possible.

SmartMamm™ - 3D Digital Mammography

3D X-ray exam of the breast with computer-aided detection for maximum accuracy in the early detection of breast cancer. Princeton Radiology's SmartMamm™ goes a step further by assessing your lifetime risk of breast cancer and including your personal risk score on your mammogram report, at no additional charge. Same day results available.

Smart Breast MRI™

A painless imaging exam without ionizing radiation that gives radiologists a closer look at breast tissue. Doctors may recommend breast MRI to further examine suspicious areas unresolved on a SmartMamm™ or for women at higher risk for breast cancer, such as those with dense breasts or a family history of breast cancer. Two options are available to accommodate women with different risk profiles or insurance situations:

- **Diagnostic Smart Breast MRI™**, which most private insurance plans cover if a woman can be shown to be at high risk or has a ruptured breast implant
- **Smart Screen Breast MRI™**, which uses selective image acquisitions shown to be more effective in finding lesions than mammography alone—recommended for concerned patients and their doctors in the absence of an insurance-covered condition for diagnostic breast MRI, with an out-of-pocket cost of \$375

Breast Ultrasound

May be recommended as a follow-up exam to acquire additional views of breast tissue after a suspicious SmartMamm™, or as a supplemental screening for women at higher risk for breast cancer, such as women with dense breasts or a family history of breast cancer.

Breast Biopsy

A suspicious finding after a breast imaging exam may lead to a recommendation of a breast biopsy. During this procedure, tissue samples from suspicious areas are extracted from the breast by an Interventional Radiologist and sent for examination by a Pathologist. Princeton Radiology physicians perform minimally invasive MRI- and Ultrasound-guided breast biopsies in convenient and comfortable outpatient settings at our Monroe, Freehold and Wayne locations. The exams are fast, with minimal discomfort, and findings are reported promptly to your doctor to reduce the anxiety of waiting.

Pelvic/Prenatal Ultrasound

An exam that provides images of the female reproductive organs -such as the uterus, cervix, ovaries and fallopian tubes- to determine the cause of abnormal bleeding, presence of cysts, fibroids, or other potential abnormalities. During pregnancy, the ultrasound can be used to determine fetal age, and to assess the growth, development and position of the baby and placenta.

DXA Body Composition Analysis

A fast, safe, and painless X-ray scan that takes a precise measurement of the ratios of bone, lean muscle, and fatty tissue in the body. DXA Body Composition is more accurate than other body composition test available in settings like gyms and health clubs. It provides useful information for people on weight management programs, athletes, and others who take a proactive approach to their health and fitness.

Bone Densitometry (DXA)

As women age, their risk increases of a debilitating disease called osteoporosis. Loss of bone mass can make bones more brittle and prone to fracture. The hips and spine are especially vulnerable. Bone Densitometry (DXA) is a fast, painless screening X-ray exam that can detect osteoporosis or earlier stages of bone loss, providing doctors with information that supports decisions on treatment. For most women, the first screening is recommended at age 65, with possible follow-ups depending on results. For women at higher risk, screenings before age 65 may be recommended.

Vein Treatments

Varicose and spider veins can cause problems that are more than skin deep, such as physical pain and effects on one's self-confidence and emotional wellness. At our Minimally Invasive Care Center in Monroe, our fellowship-trained veins specialists perform fast, convenient outpatient procedures that provide relief for women suffering from varicose or spider veins. Covered by most insurance plans and Medicare for patients experiencing medical effects or lifestyle disruptive impacts.
