Understanding Varicose Veins: It's all a matter of direction.

Your veins have an important job. They carry your blood back to the heart, which then sends it through your lungs for reoxygenation and then circulates it throughout your body to maintain normal function. To make sure your blood flows in the right direction, your veins have valves.

The valves are especially important in your legs, where your blood must move against the force of gravity. Damaged valves in your legs can cause your blood to pool and stagnate. This causes visible bulging and swelling of the veins in your legs, commonly known as varicose veins. Varicose veins can be both emotionally uncomfortable as well as cause physical pain and aching for many.

Varicose Veins and CVI.

Once the valves in your legs become damaged, they cannot repair themselves. As the veins bulge and stretch, the function of the valves worsens. The same underlying problem that causes varicose veins can lead to a related condition: Chronic Venous Insufficiency (CVI). If left untreated, CVI can lead to swelling, skin changes, inflammation, and eventually skin ulcers (open sores).

Relief at Last—with ClosureFast™

Among the vein treatments that Princeton Radiology offers is ClosureFast™. The name tells much of the story: it's a fast, effective, minimally invasive way to close problem veins, relieving the visible symptoms, physical discomfort, and complications of varicose veins.

Before

After

Before

After

ClosureFast™ eliminates the problem vein and valves, allowing the body to naturally redirect blood flow to healthy veins with competent valves. Through a tiny incision near the knee, our physician inserts a tiny catheter into the vein that uses energy from radio waves to close the vein from the inside. The closed vein gradually shrinks as part of the healing process after the procedure.

The result is visibly clearer skin and improvement or elimination of pain and discomfort caused by the diseased vein. When examined five years after ClosureFast™, nearly 95% of patients have been shown to be free of reflux (blood flow in the wrong direction).

Most insurance plans will cover ClosureFast™ for patients who are experiencing pain and discomfort from varicose veins or CVI.

We'll help you find the right vein treatment for you. Schedule a consultation with a Princeton Radiology vein specialist.

With effective, minimally invasive treatments like ClosureFast™ available, there's no reason to put up with the discomfort and embarrassment of painful, bulging varicose veins or CVI. Your first step is an initial consultation. A Princeton Radiology vein specialist—a board certified physician with advanced fellowship training in vascular disorders and minimally invasive treatments—will thoroughly evaluate your vein condition and identify a treatment plan that best meets your needs.

The right solution for better vein health, with clearer, more comfortable legs, could be as close as your phone.

Call 609.921.8211 to schedule your consultation today.
